## Summary

This invention is related to phenoxyacetic acid derivatives.

More particularly, this invention is related to:

1) phenoxyacetic acid derivatives of the formula (I):

wherein all the symbols are the same meaning as hereafter defined, and non-toxic salts thereof and non-toxic acid addition salts thereof,

2) processes for the preparation thereof, and

3) pharmaceutical agents containing them as active ingredient.

## Background of the Invention

Prostaglandin I<sub>2</sub> (PGI<sub>2</sub>) is a physiologically active natural substance having the following structural formula, which is biosynthesized from Prostaglandin H<sub>2</sub> (PGH<sub>2</sub>) in the metabolic process in vivo called arachidonate cascade.

(see Nature, 263, 663(1976), Prostaglandins, 12, 685(1976), *ibid*, 12, 915(1976), *ibid*, 13, 375(1977) and Chemical and Engineering News, Dec. 20, 17(1976)).

PGI<sub>2</sub> has been confirmed to possess not only a very strong inhibitory activity on blood platelet aggregation but a dissociative activity on blood platelet aggregation, an inhibitory activity on blood platelet adhesion, a vasodilating activity, an inhibitory activity on gastric acid secretion etc. Therefore, it has been considered that PGI<sub>2</sub> is useful for the prevention and/or the treatment for thrombosis, arteriosclerosis, ischemic heart diseases, gastric ulcer, hypertension etc. But its application for pharmaceuticals is limited because of its chemical instability and difficulty of separation of the actions according to purpose. Accordingly, various PGI<sub>2</sub> derivatives have been synthesized and many researches have been carried out for the maintenance and the separation of the actions. However, we have not necessarily satisfactory results yet.

Recently, in order to solve two problems above described, the research for PGI<sub>2</sub> receptor agonists which have a new-typed skeleton and may be useful for the treatment of or for the prevention of the above diseases, in view of PGI<sub>2</sub> receptor level, has been carried out.

## Related Arts

It has been reported in the literatures, that the following compounds not having the PGI<sub>2</sub> skeleton are PGI<sub>2</sub> receptor agonists which bind to a PGI<sub>2</sub> receptor and inhibit blood platelet aggregation:

#### Purpose of the Invention

55 Energetic investigations have been carried out in order to discover new PGI<sub>2</sub> receptor agonists having a skeleton in chemical structure different from the compounds mentioned above, the present inventors have found that a kind of phenoxyacetic acid derivatives has an activity on binding to PGI<sub>2</sub> receptor and an inhibitory activity on blood platelet aggregation, and have accomplished the present invention.

The phenoxyacetic acid derivatives of the formula (I), of the present invention are quite novel, and it is not easy to predict from the above compounds already known as PGI<sub>2</sub> receptor agonist, that the compounds of the present invention have an activity of PGI<sub>2</sub> receptor agonist.

#### Pharmacological Activities

It has been confirmed that the compounds of the present invention of the formula (I) possess an agonistic activity on  $PGI_2$  receptor by the following experimental results.

i) Inhibitory activity on binding of  $[^3H]$ -iloprost to  $PGI_2$  receptor on human blood platelet membrane fraction -

#### Method

50 mM Tris-HCl buffer (pH 7.4) containing 15 mM  $MgCl_2$ , 5 mM EDTA and 10 nM  $[^3H]$ -iloprost were used as reaction medium. To 0.2 ml of the reaction medium, human blood platelet membrane fraction (0.3 mg protein) was added with or without a test compound. The mixture was incubated at 24 °C for 30 min. After incubation, 4ml of ice-cold 10 mM Tris-HCl buffer (pH 7.4) was added to the reaction mixture, and filtered through Whatman GF/B glass fiber filter, and washed 4 times with 4 ml of ice-cold 10 mM Tris-HCl buffer (pH 7.4) to separate bound and free  $[^3H]$ -iloprost. After washing, the filter was dried and radioactivity was counted. Non-specific binding was obtained by performing parallel binding experiments in the presence of 10  $\mu$ M non-labelled iloprost. Specific binding was calculated by subtracting the non-specific binding from the total binding.

The inhibitory effect of test compound was calculated from the following equation.

$$\text{The percentage of inhibition (\%)} = 100 - (B_1/B_0 \times 100)$$

$B_1$  : specific  $[^3H]$ -iloprost binding in presence of test compound

$B_0$  : specific  $[^3H]$ -iloprost binding in absence of test compound

The results are shown in the following Table 1.

## Application for Pharmaceuticals

The compounds of the present invention, of the formula (I) possess an agonistic activity on PG12 receptor, and therefore are useful for the prevention and/or the treatment of thrombosis, arteriosclerosis, ischemic heart diseases, gastric ulcer and hypertension, etc.

For the purpose above described, the compounds of the formula (I), of the present invention, non-toxic salts thereof, acid additional salts thereof and hydrates thereof may be normally administered systemically or partially, usually by oral or parenteral administration.

The doses to be administered are determined depending upon age, body weight, symptom, the desired therapeutic effect, the route of administration, and the duration of the treatment etc. In the human adult, the doses per person per dose are generally between 1 mg and 1000 mg, by oral administration, up to several times per day, and between 100 µg and 100 mg, by parenteral administration up to several times per day, or continuous administration between 1 and 24 hrs. per day from vein.

As mentioned above, the doses to be used depend upon various conditions. Therefore, there are cases in which doses lower than or greater than the ranges specified above may be used.

When administration of the compounds of the present invention, it is used as solid compositions, liquid compositions or other compositions for oral administration, as liniments or suppositories etc. for parenteral administration.

Solid compositions for oral administration include compressed tablets, pills, capsules, dispersible powders, and granules. Capsules include hard capsules and soft capsules.

In such compositions, one or more of the active compound(s) is or are admixed with at least one inert diluent (such as lactose, mannitol, glucose, hydroxypropyl cellulose, microcrystalline cellulose, starch, polyvinylpyrrolidone, magnesium metasilicate aluminate, etc.). The compositions may also comprise, as is normal practice, additional substances other than inert diluents: e.g. lubricating agents (such as magnesium stearate etc.), disintegrating agents (such as cellulose calcium glycolate, etc.), stabilizing agents (such as lactose, etc.), and assisting agents for dissolving such as glutamic acid, etc.).

The tablets or pills may, if desired, be coated with a film of gastric or enteric material (such as sugar, gelatin, hydroxypropyl cellulose or hydroxypropylmethyl cellulose phthalate, etc.), or be coated with more than two films. And further, coating may include containment within capsules of absorbable materials such as gelatin.

Liquid compositions for oral administration include pharmaceutically-acceptable solutions, emulsions, suspensions, syrups and elixirs. In such compositions, one or more of the active compound(s) is or are contained in inert diluent(s) commonly used in the art (Purified water, ethanol etc.). Besides inert diluents, such compositions may also comprise adjuvants (such as wetting agents, suspending agents, etc.), sweetening agents, flavouring agents, perfuming agents, and preserving agents.

Spray compositions may comprise additional substances other than inert diluents: e.g. stabilizing agents (sodium sulfate etc.), isotonic buffer (sodium chloride, sodium citrate, citric acid, etc.). For preparation of such spray compositions, for example, the method described in the United States Patent No. 2,868,691 or 3,095,355 (herein incorporated in their entireties by reference) may be used.

Injections for parenteral administration include sterile aqueous or non-aqueous solutions, suspensions and emulsions. In such compositions, one more of active compounds(s) is or are admixed with at least one of inert aqueous diluent(s) (distilled water for injection, physiological salt solution etc.) or inert non-aqueous diluent(s) (propylene glycol, polyethylene glycol, olive oil, ethanol, POLYSORBATE80 (registered trade mark), etc.).

Injections may comprise additional other than inert diluents: e.g. preserving agents, wetting agents, emulsifying agents, dispersing agents, stabilizing agent (lactose, etc.), assisting agents such as assisting agents for dissolving (glutamic acid, asparaginic acid, etc.).

They may be sterilized for example, by filtration through a bacteria-retaining filter, by incorporation of sterilizing agents in the compositions or by irradiation. They may also be manufactured in the form of sterile solid compositions, for example, by freeze-drying, and which may be dissolved in sterile water or some other sterile diluent(s) for injection immediately before used.

Other compositions for parenteral administration include liquids for external use, and endermic liniments, ointment, suppositories and pessaries which comprise one or more of the active compound(s) and may be prepared by per se known methods.

## Example 16

## Methyl 3-[3-(4-diphenylmethylpyrazol-1-yl)propyl]phenoxyacetate

To a suspension of sodium hydride (217 mg, 60% dispersion) in dimethylformamide (10 ml) was added dropwise a solution of 4-diphenylmethylpyrazole (1.27 g) in dimethylformamide (50 ml) at room temperature. After stirred for 30 min at room temperature, to the mixture was added dropwise a solution of the compound prepared in reference example 9 (1.56 g) in dimethylformamide. After stirred for 1h, the mixture was quenched by addition of 1N hydrochloric acid and extracted with a mixture of ethyl acetate-n-hexane (1 : 2). The extract was washed with saturated aqueous solution of sodium chloride, dried over anhydrous magnesium sulfate, and evaporated. The residue was purified by silica gel column chromatography (ethyl acetate : n-hexane = 3 : 7) to give the title compound (2.01 g) having the following physical data.

TLC: Rf 0.59 (n-hexane : ethyl acetate = 1 : 1);

NMR:  $\delta$  7.40-7.10 (12H, m), 6.93 (1H, s), 6.80-6.60 (3H, m), 5.35 (1H, s), 4.58 (2H, s), 4.03 (2H, t,  $J=7\text{Hz}$ ), 3.79 (3H, s), 2.56 (2H, t,  $J=7\text{Hz}$ ), 2.16(2H, m).

30 Methyl 3-[3-(5-diphenylmethylisoxazol-3-yl)propyl]phenoxyacetate

To a suspension of the compound prepared in reference example 16 (300 mg), potassium bicarbonate (138 mg) in dimethylformamide (4.0 ml) was added dropwise methyl bromoacetate (0.095 ml) with stirring at room temperature. The mixture was stirred for 5h at 50 °C. The mixture was poured into water and extracted with ethyl acetate. The extract was washed with water and saturated aqueous solution of sodium chloride, successively, dried over anhydrous magnesium sulfate, and evaporated. The residue was purified by silica gel column chromatography (benzene : ethyl acetate = 19 : 1) to give the title compound (350 mg) having the following physical data.
